Homing-based CRISPR-mediated gene drive

Medea & toxin-antidote based gene drive

Transgenic mothers produce toxin

		Male				
		TT	Tt	Tt	tt	
Female	TT	TT ₁	TT ₂	Tt ₆	Tt ₅	
	Tt	TT ₃	TT ₄	Tt ₈	Tt ₇	
	tt	Tt ₁₁	Tt ₈	tt ₁₄	tt ₁₃	
		tt	Tt ₉	Tt ₁₀	tt ₁₂	tt

Transgenic offspring produce antidote

		Male				
		TT	Tt	Tt	tt	
Female	TT	TT ₁	TT ₂	Tt ₆	Tt ₅	
	Tt	TT ₃	TT ₄	Tt ₈	Tt ₇	
	tt	Tt ₁₁	Tt ₈	tt ₁₄	tt ₁₃	
		tt	Tt ₉	Tt ₁₀	tt ₁₂	tt

		Male				
		TT	Tt	Tt	tt	
Female	TT	TT ₁	TT ₂	Tt ₆	Tt ₅	
	Tt	TT ₃	TT ₄	Tt ₈	Tt ₇	
	tt	Tt ₁₁	Tt ₈	tt₁₄	tt₁₃	
		tt	Tt ₉	Tt ₁₀	tt ₁₂	tt

This causes the death of all offspring of heterozygous mothers that do not inherit the Medea allele (tt).

Public attitudes to gene editing for malaria control in Mali

“You have to start somewhere. From this, people will know whether it’s good or bad... I would like you to conduct a trial in my village because I would like to be an example for another community.”

Elder, Koporo-na, Mali

“I would have to see an example of modified mosquitoes reducing malaria in another village before I believe this claim”

Elder, Tienfala, Mali

- Marshal JM, Toure MB, Traore MM, Famenini S, Taylor CE (2010) Malaria Journal 9: 128

Semele & threshold-dependent gene drive

Transgenic males produce toxic semen

		Male			
		TT	Tt	Tt	tt
Female	TT	TT_1	TT_2	Tt_6	Tt_5
	Tt	TT_3	TT_4	Tt_8	Tt_7
	tt	Tt_{11}	Tt_8	tt_{14}	tt_{13}

Transgenic females produce antidote

		Male			
		TT	Tt	Tt	tt
Female	TT	TT_1	TT_2	Tt_6	Tt_5
	Tt	TT_3	TT_4	Tt_8	Tt_7
	tt	Tt_{11}	Tt_8	tt_{14}	tt_{13}

		Male			
		TT	Tt	Tt	tt
Female	TT	TT_1	TT_2	Tt_6	Tt_5
	Tt	TT_3	TT_4	Tt_8	Tt_7
	tt	Tt_{11}	Tt_8	tt_{14}	tt_{13}

This causes crosses between **transgenic males** and **wild females** to produce **no viable offspring**.

Mosquito Gene Drive Explorer

Brief Description

MGDrivE is a framework designed to serve as a testbed in which gene-drive releases for mosquito-borne diseases control can be tested. It is being developed to accommodate various mosquito-specific gene drive systems within a population dynamics model that allows migration of individuals between nodes in a spatial landscape.

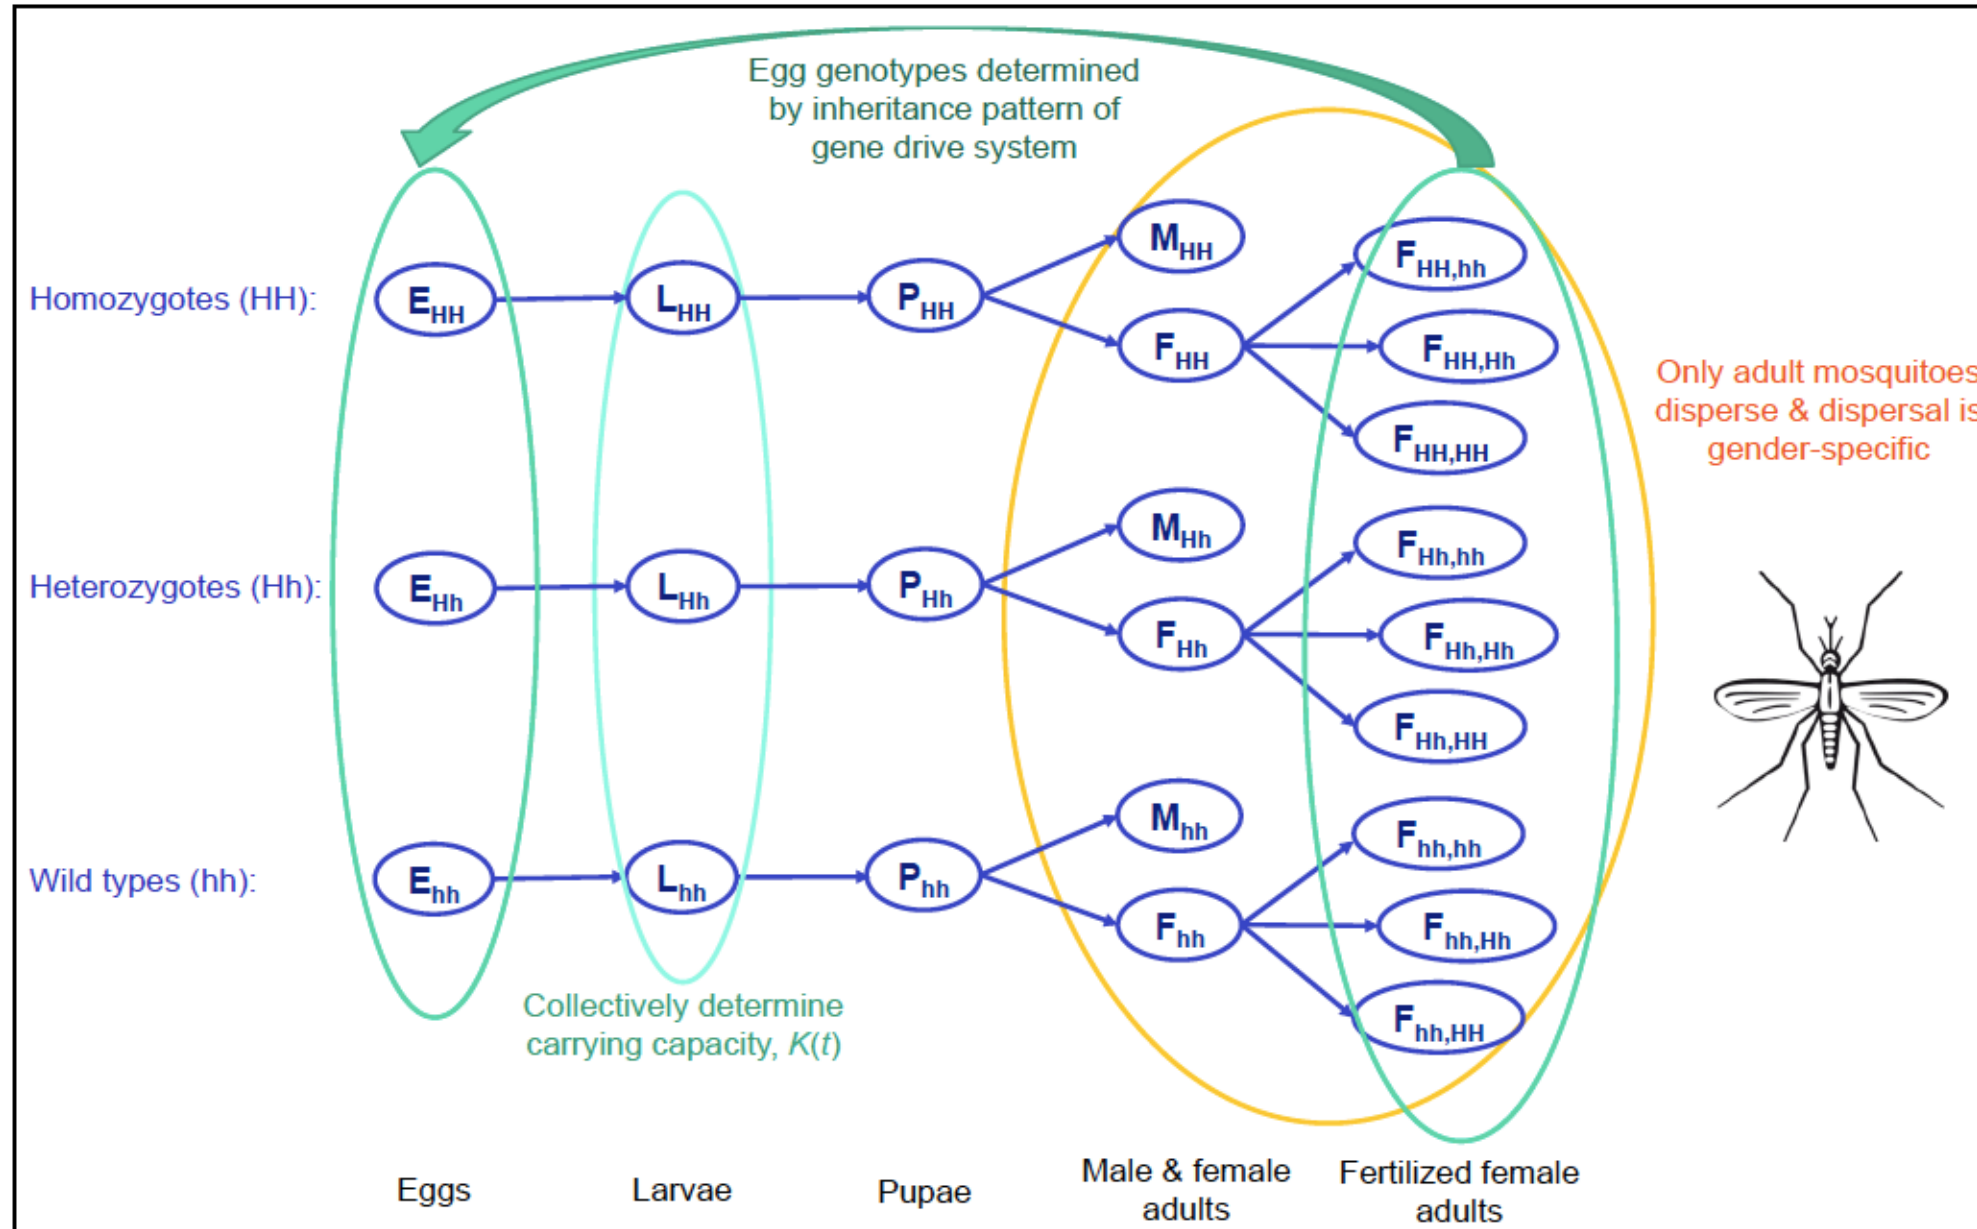

Demonstration

MGDrivE: Inheritance module

MGDrivE: Ecology module

Mosquito vector species of interest

Aedes aegypti

Anopheles gambiae

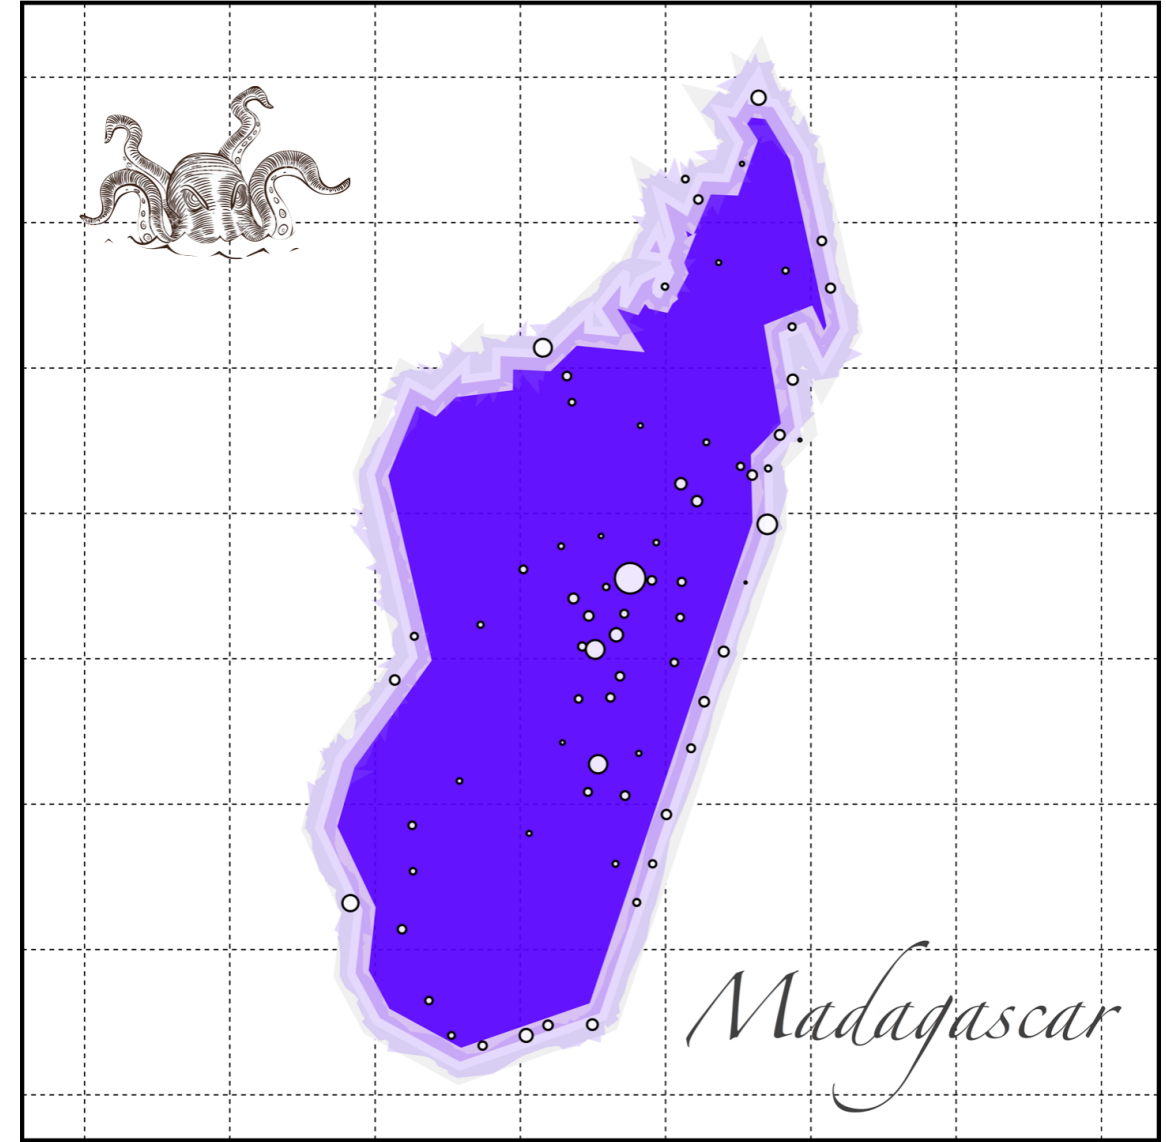

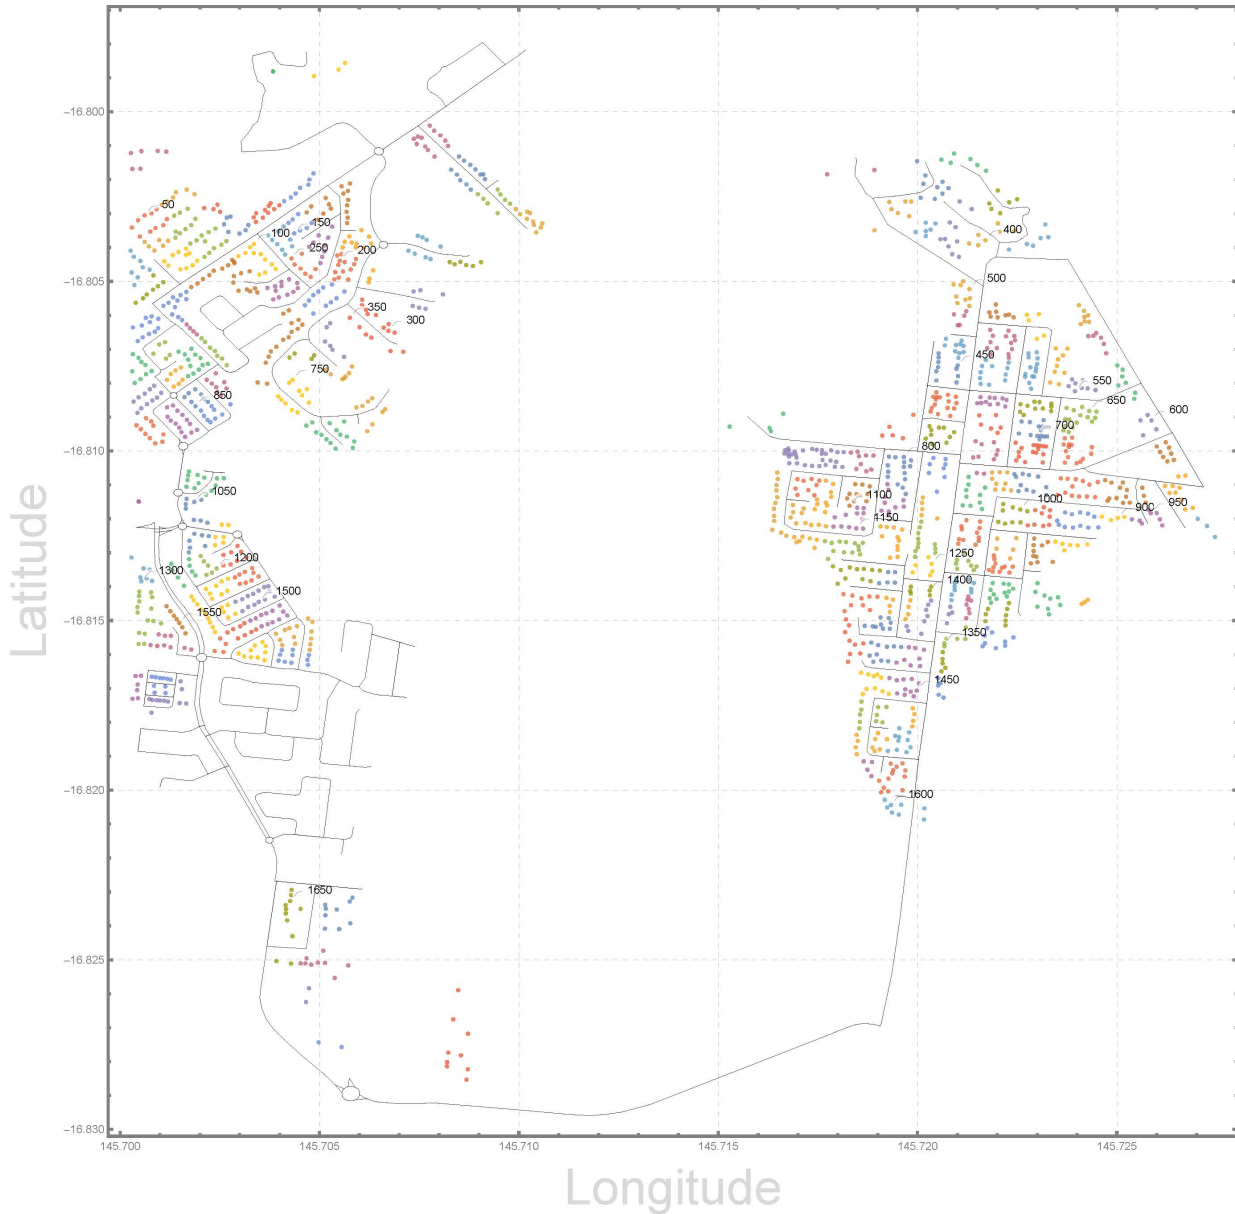

Anopheles stephensi

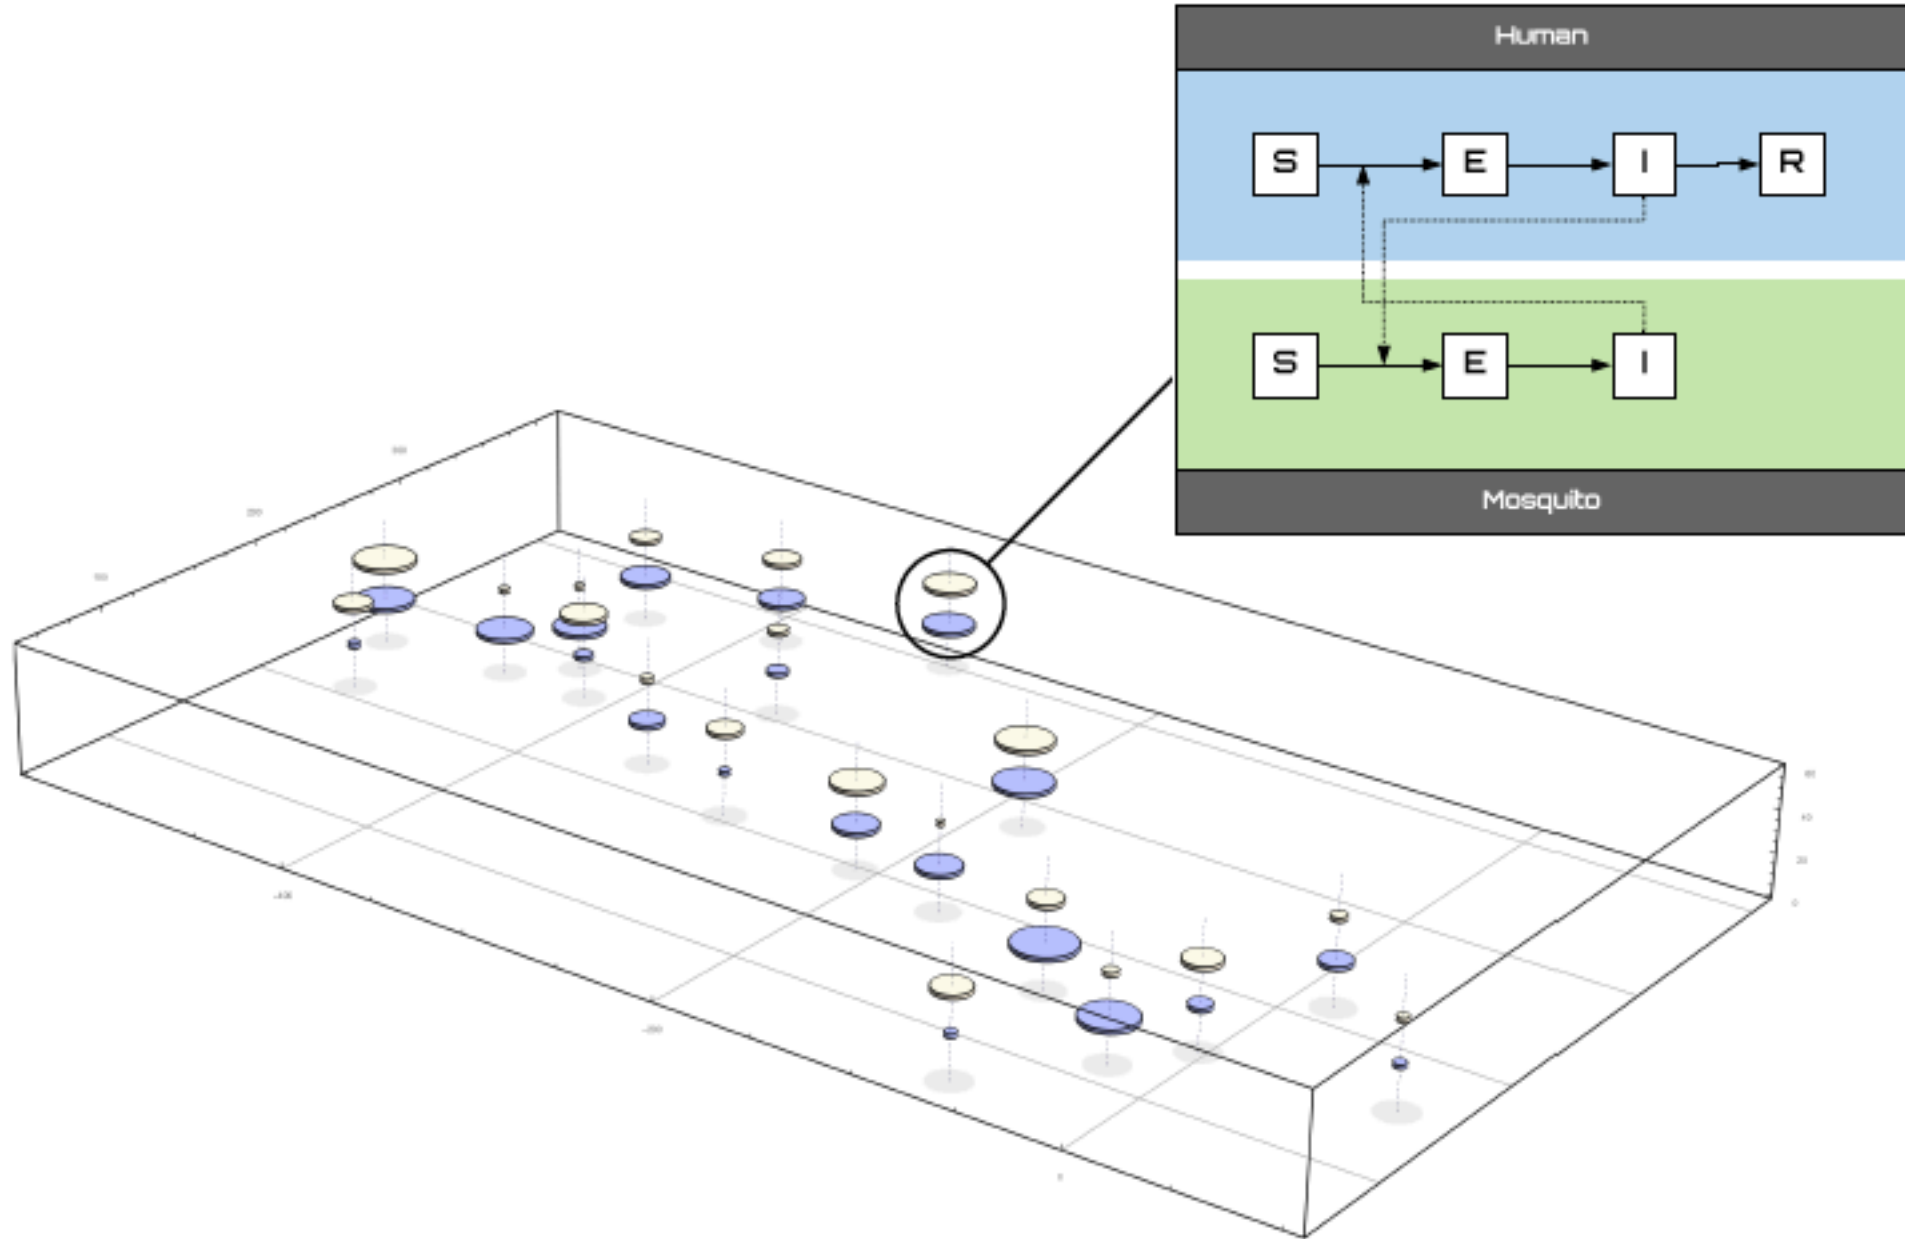

MGDrivE: Landscape module

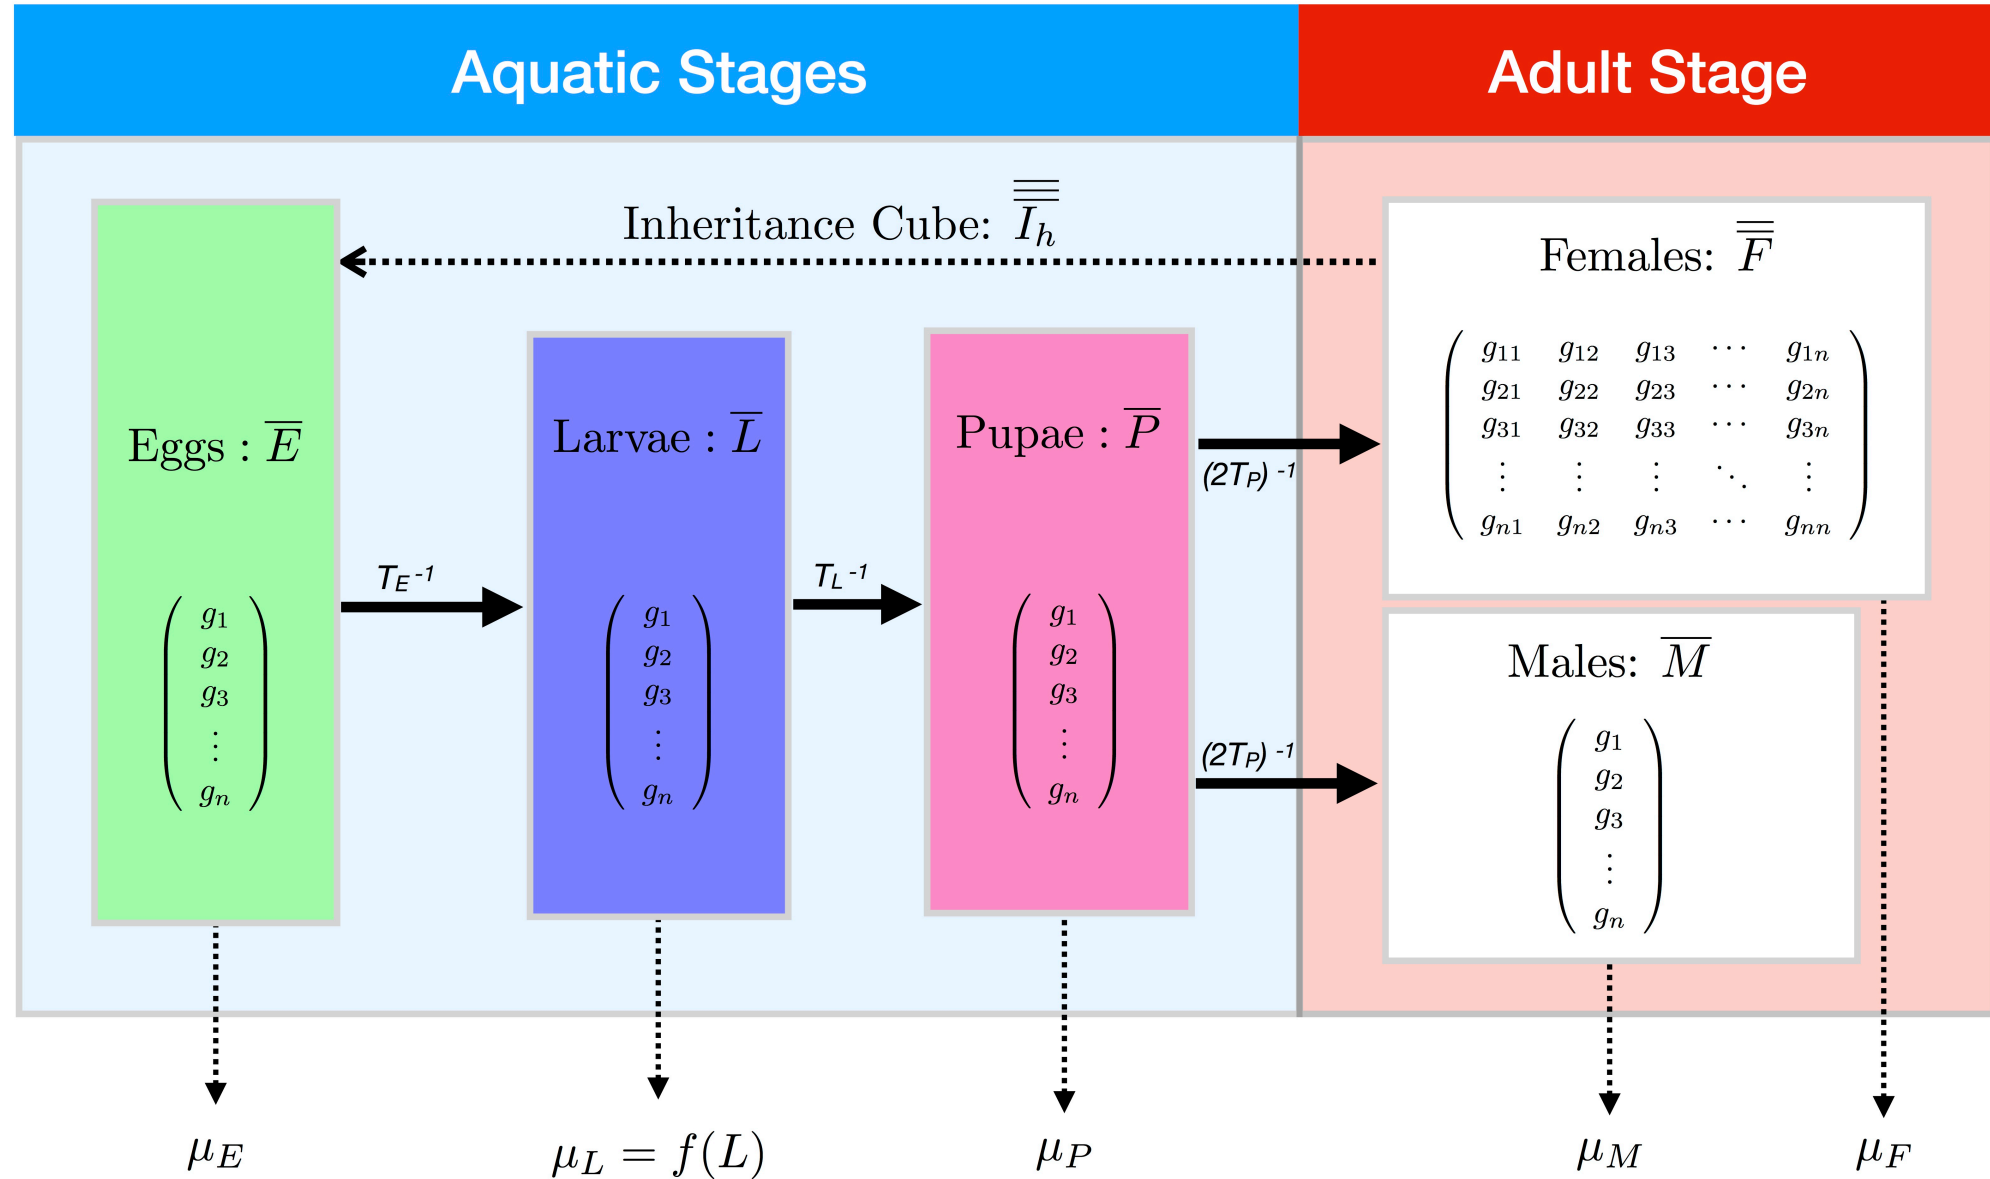

Landscapes of interest for mosquito vectors

Epidemiological extension for mosquito-borne diseases

MGDrivE: Tensor modeling framework

MGDrivE: Tensor modeling framework

Inheritance & oviposition:

$$\overline{O(T_x)} = \sum_{j=1}^n \left(\left((\beta * \bar{s} * \overline{Af[t-T_x]}) * \overline{Ih} \right) * \Lambda \right)_{ij}^T$$

Adult male survival & development:

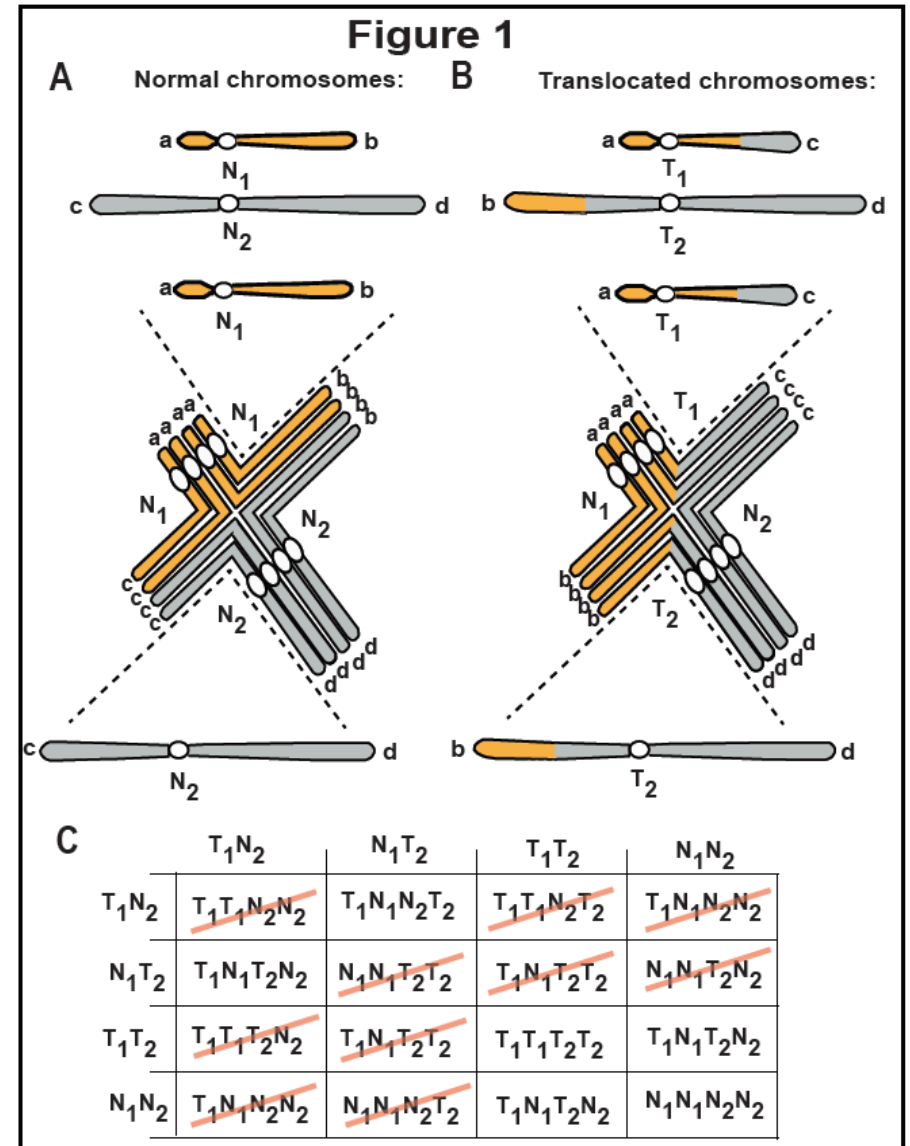

$$\overline{Am[t]} = \overline{Am[t-1]} * (1 - \mu_{ad}) * \overline{\omega_m} + (1 - \overline{\phi}) * \overline{E'} + \overline{vm[t-1]}$$

Adult male migration:

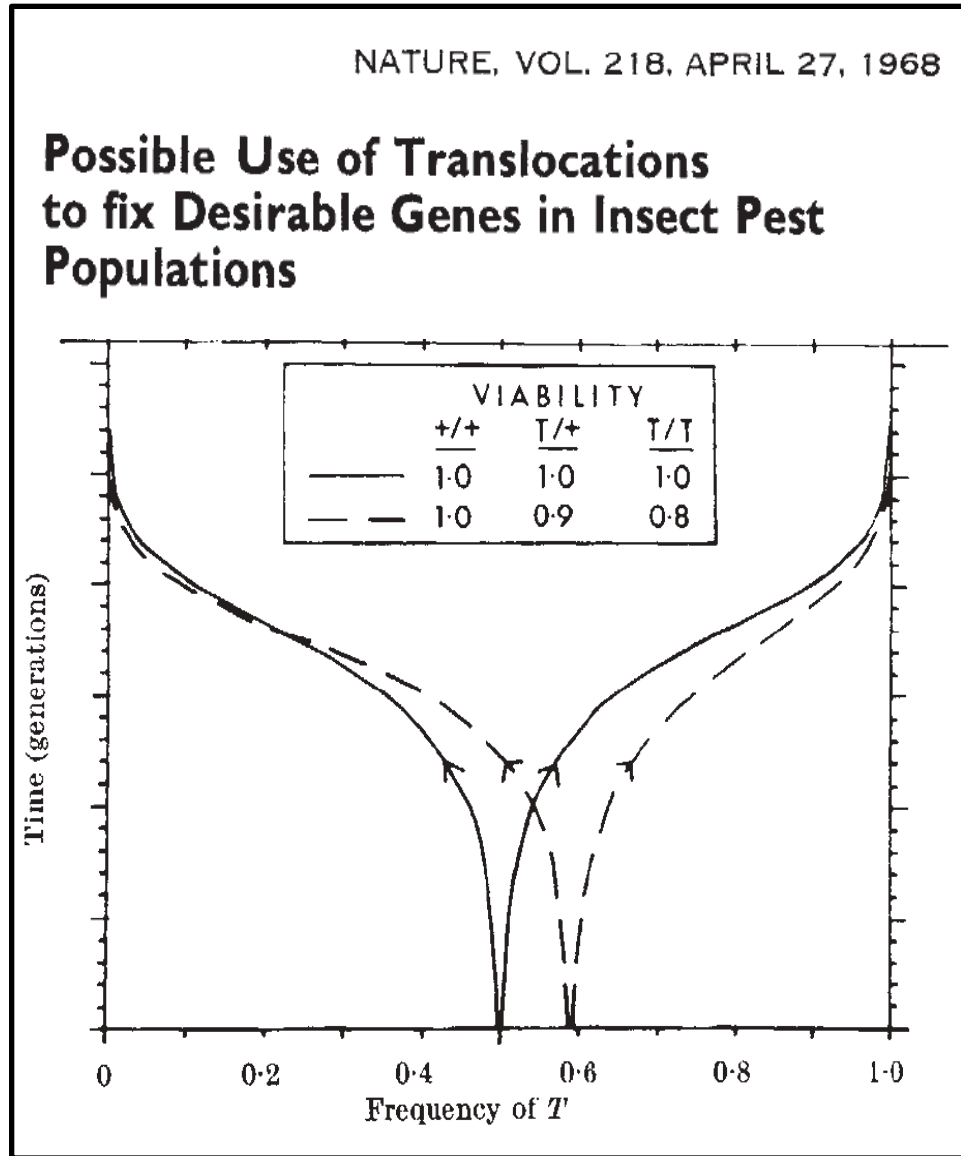

$$\overline{Am^i(t)} = \sum A_m^j \otimes \overline{\tau m[t-1]}$$

Q2. Can CRISPR-based gene drive be effective at controlling disease on a wide scale?

Homing-based gene drive targeting a female fertility gene & resistant allele generation

LETTERS

nature
biotechnology

A CRISPR-Cas9 gene drive system targeting female reproduction in the malaria mosquito vector *Anopheles gambiae*

- Homing rate = 98%
- Non-cleavage rate = 1%
- Resistant allele generation rate = 0.13% (in-frame indels)
- Fertility of heterozygous females reduced by 90.7%

Expected dynamics of Hammond *et al.* (2016) construct

- Homing rate = 98%
- Non-cleavage rate = 1%
- Resistant allele generation rate = 0.13% (in-frame indels)
- Fertility of heterozygous females reduced by 90.7%

- Homing rate = 98%
- Non-cleavage rate = 1%
- Resistant allele generation rate = 0.13% (in-frame indels)
- *Fertility of heterozygous females same as wild-type*

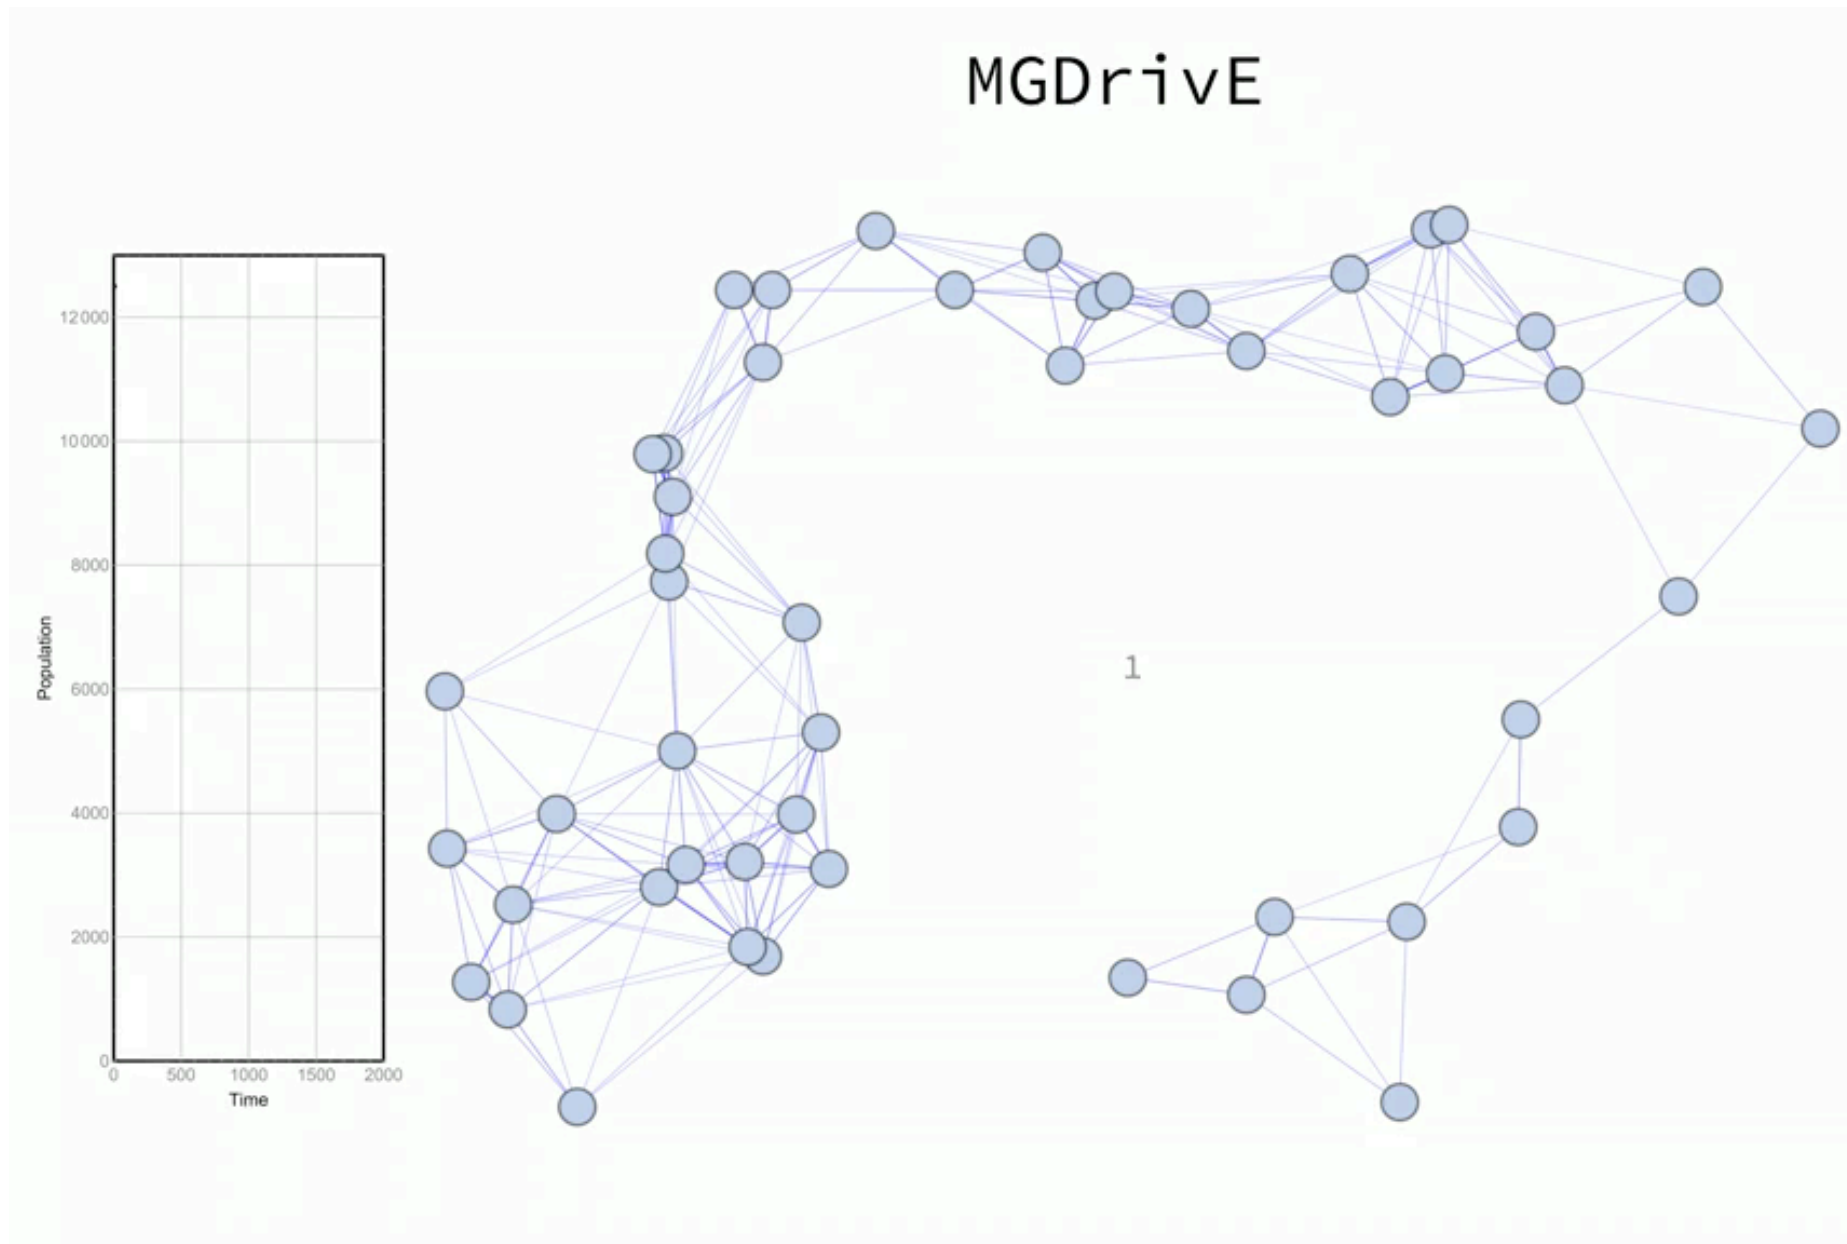

- Marshall JM, Buchman A, Sanchez HM *et al.* (2017) Nature Sci Rep 7: 3776

Multiplexing gRNAs as a solution to resistant alleles

Multiplex number:	Resistance allele generation rate:	Population size capable of eliminating (90% of sims):
1	1.3×10^{-3}	32
2	1.7×10^{-6}	24 thousand
3	2.2×10^{-9}	19 million
4	2.9×10^{-12}	14 billion

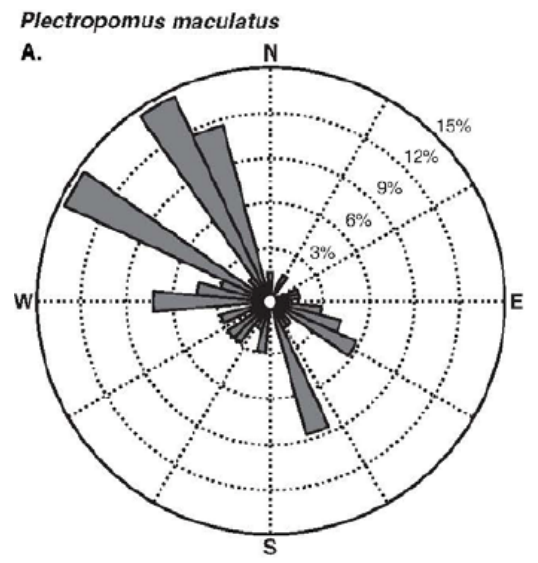

MGDrive: Homing-based gene drive with resistance

Q3. What are the best approaches for quantifying mosquito movement patterns of relevance to both questions?

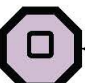

Fine-scale movement patterns from parentage analysis

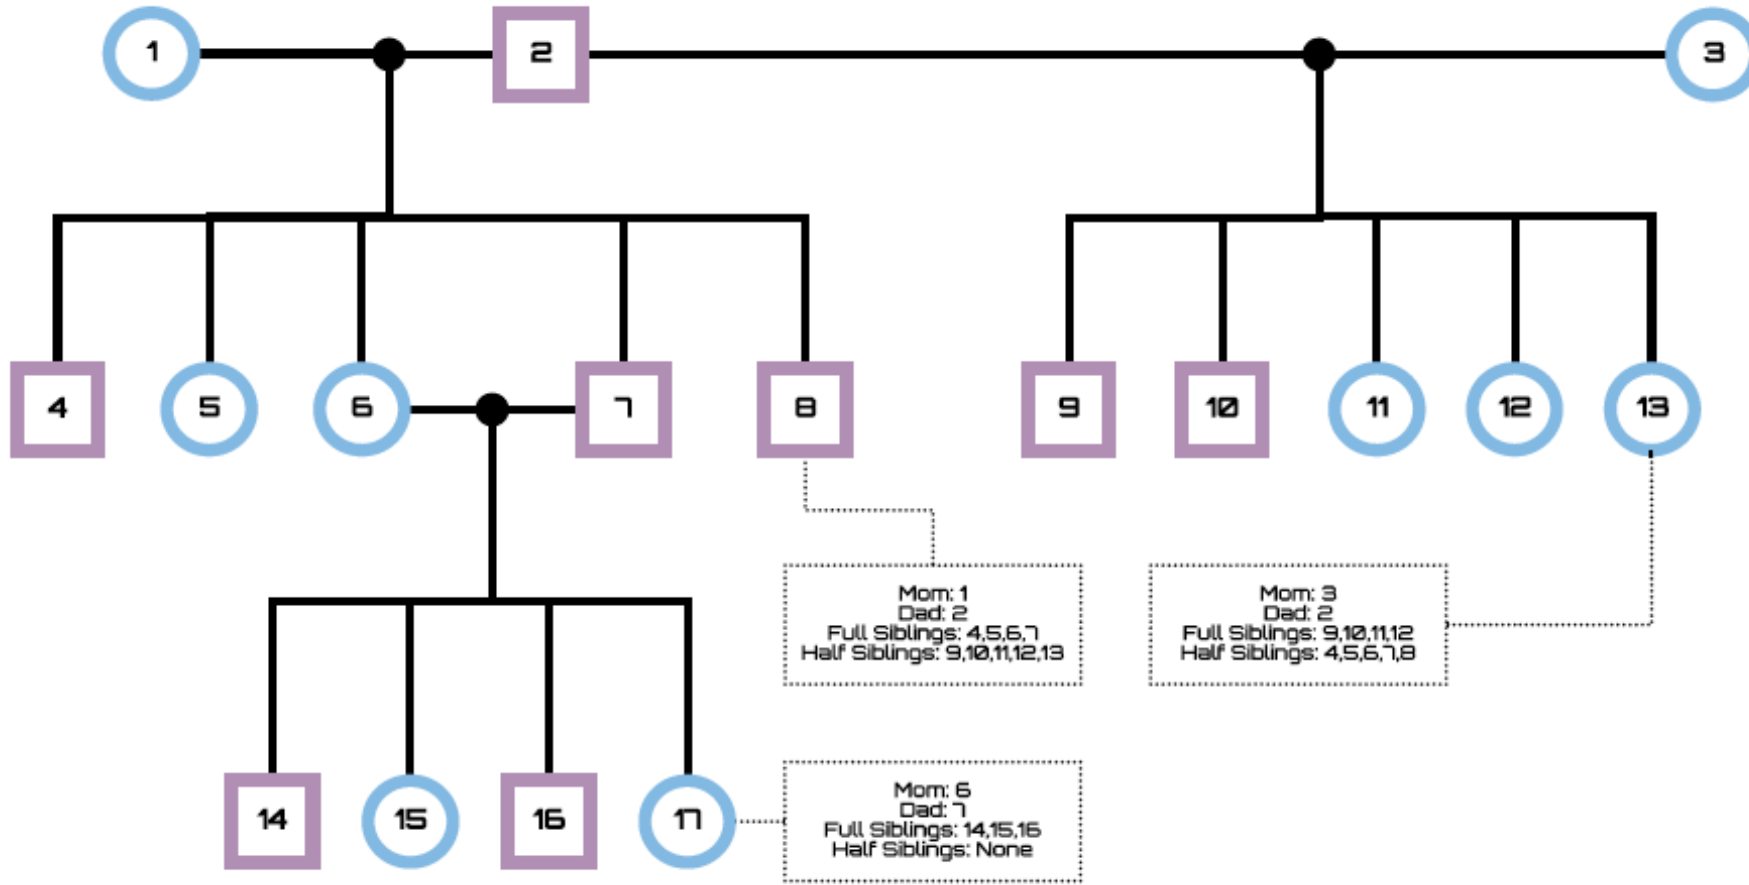

- Williamson DH, Harrison HB, Almany GR, Berumen ML *et al.* (2016) *Mol. Ecol.* 25L 6039-6054

Close-kin capture methods to infer mosquito dispersal

Close-Kin Pair	Event Histories by which distances accumulate		
Mother-Offspring (larval)		 <p>Mother oviposits, larva sampled</p>	<p>Mother disperses →</p>  <p>Mother sampled</p>
Father-Offspring (larval)	 <p>Mother oviposits, larva sampled</p>	<p>Mother disperses ←</p>  <p>Mating</p>	<p>Father disperses →</p>  <p>Father sampled</p>
Mother-Offspring (adult)	 <p>Adult offspring sampled</p>	<p>Adult offspring disperses ←</p>  <p>Mother oviposits</p>	<p>Father disperses →</p>  <p>Mother sampled</p>
Full-Sibling (adult)	 <p>Adult offspring sampled</p>	<p>Adult offspring disperses ←</p>  <p>Mother oviposits</p>	<p>Mother disperses →</p>  <p>Mother oviposits</p> <p>Adult offspring disperses →</p>  <p>Adult offspring sampled</p>

Incorporating parental IDs into MGDriveE

Importance of environmental barriers for *Ae. aegypti*

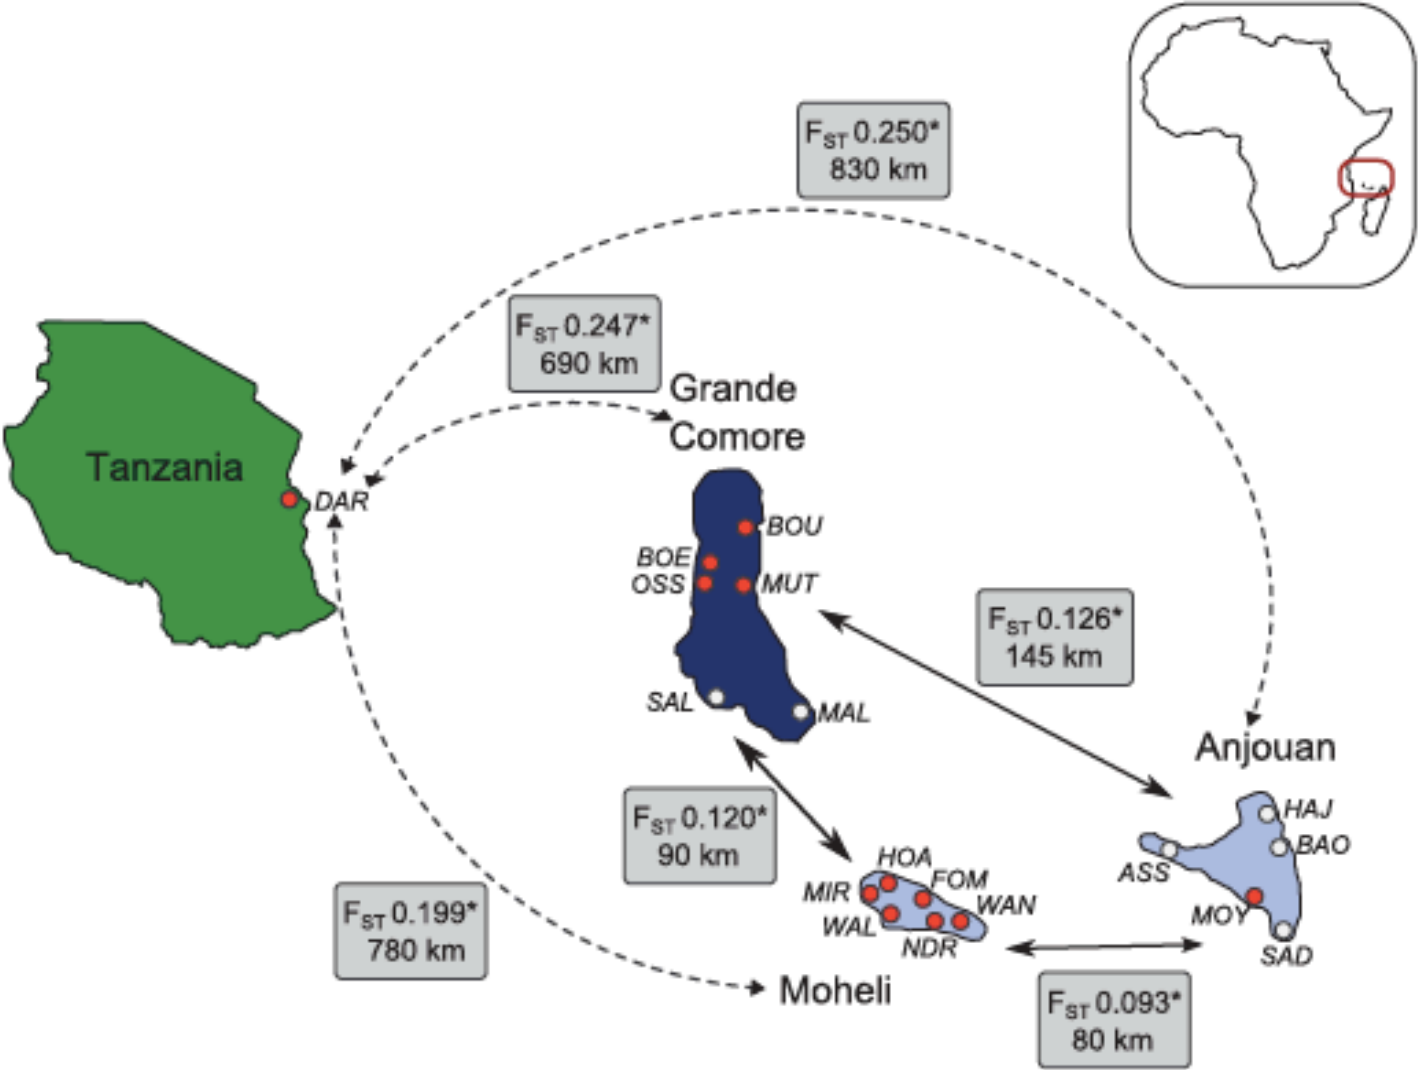

Figure 3: Loiselle's k estimates for sample pairs of relatedness $k > 0.046875$. Pairs of $0.09375 < k < 0.1875$ are most likely half-sibs, those of $k < 0.1875$ are most likely full-sibs. Most related pairs were found within the same trap, but separation distances of up to 1312m were observed.

Intermediate movement from identity by descent (IBD)

- Ringbauer H, Coop G, Barton NH (2017) Genetics doi: 10.1534/genetics.116.196220.

Summary

Q1. Can we conduct a confined field trial of gene-edited mosquitoes?

- Threshold-dependent systems may be confineable to partially isolated populations
- More study is needed on mosquito population structure

Q2. Can CRISPR-based gene drive be effective at controlling disease on a wide scale?

- Multiplexing guide RNAs could sufficiently reduce resistant allele generation rates
- More study is needed of the molecular mechanisms

Q3. What are the best approaches for quantifying mosquito movement patterns of relevance to both questions?

- Close-kin capture methods are promising for inferring details of the fine-scale movement patterns of mosquitoes
- IBD methods may be appropriate for inferring intermediate-to-long distance dispersal
